Problem

Manual Accounts Payable processing is slow, costly ($12–$40 per invoice), and error-prone, with each invoice taking an average of 14.6 days to complete. At ADS, a 6-person team must manually handle over 150,000 invoices annually from 3,000 suppliers in varied formats, creating significant workload, delays, and scalability challenges.

Solution

AI² is a web-based platform that streamlines high-volume invoice processing by automating repetitive tasks, adapting to diverse formats, and prioritizing exceptions. It reduces manual workload while improving speed, accuracy, and compliance within existing financial workflows.

Problem Characteristics

- Labor accounts for 62% of total AP processing costs, mostly consisting of repetitive checking rather than value-added work
- 39% of invoices contain errors, and ⅓ of businesses suffer from making duplicate payments
- Invoices take an average of 14.6 days to process, payments slowed down due to backlogs, leading to missed discounts and late fees.
- Already high pressure on the AP team makes it difficult for the company to take on additional clients, limiting financial growth.

Solution Characteristics

- All invoices are automatically captured from email and structured for review, reducing manual file handling.
- AI² automatically compares invoices to purchasing orders, accelerating processing while minimizing errors and backlogs.
- Match-scoring and automated flagging for review ensures fewer mismatches, duplicates, and overlooked errors.
- Every invoice and action is tracked in the database, ensuring auditability, compliance, and organizational trust.
- Staff intervention allows the system to continously improve, which in turn reduces redundancies in their daily work.

Innovative Features vs. Competition

	AI²	Tipalti	SAP Concur	QuickBooks	Manual Processing
